

SEARCH ENGINE OPTIMISATION IN A NUTSHELL ...

A STARTER GUIDE FOR BUSINESS OWNERS

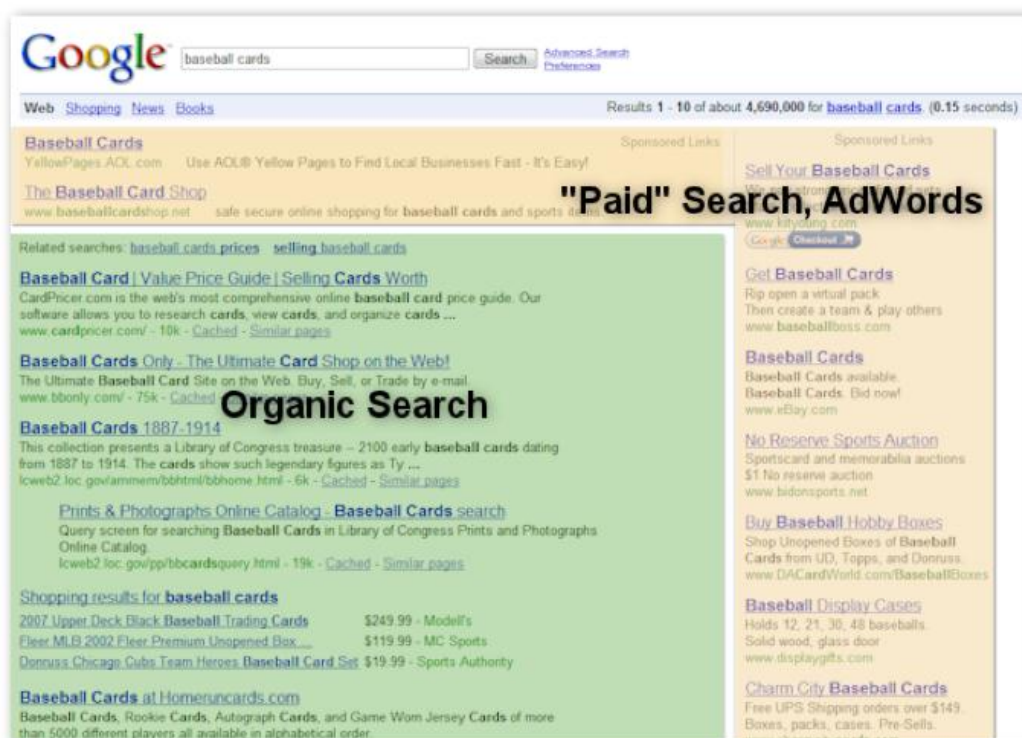

Published October 2010

The guide is intended for webmasters that are new to the topic of search engine optimisation and wish to improve their sites' interaction with both users and search engines. Although this guide won't tell you any secrets that'll automatically rank your site first for queries in Google (sorry!), following the best practices outlined here will make it easier for search engines to both crawl and index your content.

Links and references can be found on our website at www.spiral.co.nz/SEONutshell.

Search engine optimisation is often about making small modifications to parts of your website. When viewed individually, these changes might seem like incremental improvements, but when combined with other optimisations, they could have a noticeable impact on your site's user experience and performance in organic search results. You're likely already familiar with many of the topics in this guide, because they're essential ingredients for any webpage, but you may not be making the most out of them.

Search engine optimization affects only organic search results, not paid or "sponsored" results, such as Google AdWords

Even though this guide's title contains the words "search engine", we'd like to say that you should base your optimisation decisions first and foremost on what's best for the visitors of your site. They're the main consumers of your content and are using search engines to find your work. Focusing too hard on specific tweaks to gain ranking in the organic results of search engines may not deliver the desired results. Search engine optimisation is about putting your site's best foot forward when it comes to visibility in search engines.

To help with our explanations we will follow a fictitious website throughout the guide. Here's some background information about the site we'll use:

- Website/business name: "Brandon's Baseball Cards"
- Domain name: brandonsbaseballcards.com

- Focus: Online-only baseball card sales, price guides, articles, and news content
- Size: Small, ~250 pages

Your site may be smaller or larger than this and offer vastly different content, but the optimisation topics we discussed below will apply to sites of all sizes and types.

We hope this guide gives you some fresh ideas on how to improve your website, and we'd love to hear your questions, feedback, and success stories.

••••

CREATE UNIQUE, ACCURATE PAGE TITLES

A title tag tells both users and search engines what the topic of a particular page is. The <title> tag should be placed within the <head> tag of the HTML document. Ideally, you should create a unique title for each page on your site.

```
<html>
<head>
<title>Brandon's Baseball Cards - Buy Cards, Baseball News, Card Prices</title>
<meta name="description" content="Brandon's Baseball Cards provides a large selection of baseball cards, price guides, and news.">
</head>
<body>
...
```

The title of the homepage for our baseball card site, which lists the business name and three main focus areas

If your document appears in a search results page, the contents of the title tag will usually appear in the first line of the results (If you're unfamiliar with the different parts of a Google search result, you might want to check out the anatomy of a search result video by Google engineer Matt Cutts – available on our website). Words in the title are bolded if they appear in a person's search query. This can help people recognise if the page is likely to be relevant to their search.

The title for your homepage can list the name of your website/business and could include other bits of important information like the physical location of the business or maybe a few of its main focuses or offerings.

A user performs the query [baseball cards]

[Brandon's Baseball Cards - Buy Cards, Baseball News, Card Prices](#)

Brandon's Baseball Cards provides a large selection of vintage and modern era baseball cards for sale. We also offer daily baseball news and events in ...

[www.brandonsbaseballcards.com/](#) - 30k - [Cached](#) - [Similar pages](#)

Our homepage shows up as a result, with the title listed on the first line (notice that the query terms the user searched for appear in bold)

If the user clicks the result and visits the page, the page's title will appear at the top of the browser

Titles for deeper pages on your site should accurately describe the focus of that particular page and also might include your site or business name.

A user performs the query [rarest baseball cards]

[Top Ten Rarest Baseball Cards - Brandon's Baseball Cards](#)

These ten baseball cards are the rarest in the world. Here's the story behind each card and how much you could expect to pay for them at auction. Many will ...

[www.brandonsbaseballcards.com/articles/ten-rarest-baseball-cards.htm](#) - 34k - [Cached](#) - [Similar pages](#)

A relevant, deeper page (its title is unique to the content of the page) on our site appears as a result

Good practices for page title tags

Accurately describe the pages content

Choose a title that effectively communicates the topic of the pages content. Avoid:

- choosing a title that has no relation to the content on the page
- using default or vague titles like "Untitled" or "New Page 1"

Create unique title tags for each page

Each of your pages should ideally have a unique title tag, which helps Google know how the page is distinct from the others on your site. Avoid:

- using a single title tag across all your sites pages or a large group of pages

Use brief, but descriptive titles

Titles can be both short and informative. If the title is too long, Google will show only a portion of it in the search result. As a guide your headings should be between 5 and 12 words in length. Avoid:

- using extremely lengthy titles that are unhelpful to users
- stuffing unneeded keywords in your title tags

MAKE USE OF THE “DESCRIPTION” META TAG

A page's description meta tag gives Google and other search engines a summary of what the page is about. Whereas a page's title may be a few words or a phrase, a page's description meta tag might be a sentence or a short paragraph. Google Webmaster Tools provides a handy content analysis section that'll tell you about any description meta tags that are either too short, long, or duplicated too many times (the same information is also shown for <title> tags). Like the <title> tag, the description meta tag is placed within the <head> tag of your HTML document.

```
<html>
<head>
<title>Brandon's Baseball Cards - Buy Cards, Baseball News, Car
<meta name="description" content="Brandon's Baseball Cards prov
</head>
<body>
...
```

The beginning of the description meta tag for our homepage, which gives a brief overview of the site's offerings

Description meta tags are important because Google might use them as snippets for your pages.

We say "might" because Google may choose to use a relevant section of your page's visible text if it does a good job of matching up with a user's query. Alternatively, Google might use your site's description in the Open Directory Project if your site is listed. Adding description meta tags to each of your pages is always a good practice in case Google cannot find a good selection of text to use in the snippet. Our website has an informative post on improving snippets with better description meta tags.

A user performs the query [baseball cards]

[Brandon's Baseball Cards - Buy Cards, Baseball News, Card Prices](#)
Brandon's **Baseball Cards** provides a large selection of vintage and modern era **baseball cards** for sale. We also offer daily **baseball** news and events in ...
[www.brandonsbaseballcards.com/](#) - 30k - [Cached](#) - [Similar pages](#)

Our homepage appears as a result, with part of its description meta tag used as the snippet

Words in the snippet are bolded when they appear in the user's query. This gives the searcher clues about whether the content on the page matches with what he or she is looking for. Below is another example, this time showing a snippet from a description meta tag on a deeper page (which ideally has its own unique description meta tag) containing an article.

A user performs the query [rarest baseball cards]

One of our deeper pages, with its unique description meta tag used as the snippet, appears as a result

Good practices for description meta tags

Accurately summarize the page's content

Write a description that would both inform and interest users if they saw your description meta tag as a snippet in a search result. Avoid:

- writing a description meta tag that has no relation to the content on the page using generic descriptions like "This is a webpage" or "Page about baseball cards"
- filling the description with only keywords
- copy and pasting the entire content of the document into the description meta tag

Use unique descriptions for each page

Having a different description meta tag for each page helps both users and Google, especially in searches where users may bring up multiple pages on your domain (e.g. searches using the site: operator). If your site has thousands or even millions of pages, hand-crafting description meta tags probably isn't feasible. In this case, you could automatically generate description meta tags based on each page's content. Avoid:

- using a single description meta tag across all of your site's pages or a large group of pages

MAKE YOUR SITE EASIER TO NAVIGATE

The navigation of a website is important in helping visitors quickly find the content they want. It can also help search engines understand what content the webmaster thinks is important. Although Google's search results are provided at a page level, Google also likes to have a sense of what role a page plays in the bigger picture of the site.

All sites have a home or "root" page, which is usually the most frequented page on the site and the starting place of navigation for many visitors. Unless your site has only a handful of pages, you should think about how visitors will go from a general page (your home page) to a page containing more specific content. Do you have enough pages around a specific topic area that it would make

sense to create a page describing these related pages (e.g. home page -> related topic listing -> specific topic)?

Do you have hundreds of different products that need to be classified under multiple category and subcategory pages?

```

```

The directory structure for our small website on baseball cards

A sitemap (lower-case) is a simple page on your site that displays the structure of your website, and usually consists of a hierarchical listing of the pages on your site. Visitors may visit this page if they are having problems finding pages on your site. While search engines will also visit this page, getting good crawl coverage of the pages on your site, it's mainly aimed at human visitors.

An XML Sitemap (upper-case) file, which you can submit through Google's Webmaster Tools, makes it easier for Google to discover the pages on your site. Using a Sitemap file is also one way (though not guaranteed) to tell Google which version of a URL you'd prefer as the canonical one (e.g. <http://brandonsbaseballcards.com/> or <http://www.brandonsbaseballcards.com>).

Good practices for site navigation

Create a naturally flowing hierarchy

Make it as easy as possible for users to go from general content to the more specific content they want on your site. Add navigation pages when it makes sense and effectively work these into your internal link structure. Avoid:

- creating complex webs of navigation links, e.g. linking every page on your site to every other page
- going overboard with slicing and dicing your content e.g it takes twenty clicks to get to deep content

Use mostly text for navigation

Controlling most of the navigation from page to page on your site through text links makes it easier for search engines to crawl and understand your site. Many users also prefer this over other approaches, especially on some devices that might not handle Flash or JavaScript. Avoid:

- having a navigation based entirely on JavaScript drop-down menus, images, or animations (many, but not all, search engines can discover such links on a site, but if a user can reach all pages on a site via normal text links, this will improve the accessibility of your site)

Use "breadcrumb" navigation

A breadcrumb is a row of internal links at the top or bottom of the page that allows visitors to quickly navigate back to a previous section or the home page. Many breadcrumbs have the most general page (usually the home page) as the first, left-most link and list the more specific sections out to the right.

[Brandon's Baseball Cards](#) > [Articles](#) > Top Ten Rarest Baseball Cards

Breadcrumb links appearing on a deeper article page on our site

Put an HTML sitemap page on your site, and use an XML Sitemap file

A simple sitemap page with links to all of the pages or the most important pages (if you have hundreds or thousands) on your site can be useful. Creating an XML Sitemap file for your site helps ensure that search engines discover the pages on your site. Avoid:

- letting your HTML sitemap page become out of date with broken links
- creating an HTML sitemap that simply lists pages without organizing them, for example by subject

Consider what happens when a user removes part of your URL

Some users might navigate your site in odd ways, and you should anticipate this. For example, instead of using the breadcrumb links on the page, a user might drop off a part of the URL in the hopes of finding more general content. He or she might be visiting <http://www.brandonsbaseballcards.com/news/2008/upcoming-baseball-card-shows.htm>, but then enter <http://www.brandonsbaseballcards.com/news/2008/> into the browser's address bar, believing that this will show all news from 2008. Is your site prepared to show content in this situation or will it give the user a 404 ("page not found" error)? What about moving up a directory level to <http://www.brandonsbaseballcards.com/news/>?

Have a useful 404 page

Users will occasionally come to a page that doesn't exist on your site, either by following a broken link or typing in the wrong URL. Having a custom 404 page that kindly guides users back to a working page on your site can greatly improve a user's experience. Your 404 page should probably have a link back to your home page and could also provide links to popular or related content on your site. You can use Google Webmaster Tools to find the sources of URLs causing "not found" errors. Avoid:

- allowing your 404 pages to be indexed in search engines (make sure that your webserver is configured to give a 404 HTTP status code when non-existent pages are requested)
- providing only a vague message like "Not found", "404", or no 404 page at all
- using a design for your 404 pages that isn't consistent with the rest of your site

OFFER QUALITY CONTENT AND SERVICES

Creating compelling and useful content will likely influence your website more than any of the other factors discussed here. Users know good content when they see it and will likely want to direct other users to it. This could be through blog posts, social media services, email, forums, or other means. Organic or word-of-mouth buzz is what helps build your site's reputation with both users and Google, and it rarely comes without quality content.

Rare Baseball Cards You Wished You Owned

Posted by Shaun on October 1, 2008 @ 8:25PM - Filed under [Vintage Cards](#)

[Brandon's Baseball Cards](#) recently posted a neat article on the [rarest cards](#) in known existence. You might have heard of some of them, but a few will be a surprise to you. Check it out!

A blogger finds a piece of your content, likes it, and then references it in a blog post

While the content you create could be on any topic imaginable, here are some recommended best practices:

Good practices for content

Write easy-to-read text

Users enjoy content that is well written and easy to follow. Avoid:

- writing sloppy text with many spelling and grammatical mistakes
- embedding text in images for textual content (users may want to copy and paste the text and search engines can't read it)

Stay organized around the topic

It's always beneficial to organize your content so that visitors have a good sense of where one content topic begins and another ends. Breaking your content up into logical chunks or divisions helps users find the content they want faster. Avoid:

- dumping large amounts of text on varying topics onto a page without paragraph, subheading, or layout separation

Use relevant language

Think about the words that a user might search for to find a piece of your content. Users who know a lot about the topic might use different keywords in their search queries than someone who is new to the topic. For example, a long-time baseball fan might search for [nlcs], an acronym for the National League Championship Series, while a new fan might use a more general query like [baseball playoffs]. Anticipating these differences in search behavior and accounting for them while writing your content (using a good mix of keyword phrases) could produce positive results. Google AdWords provides a handy Keyword Tool that helps you discover new keyword variations and see the approximate search volume for each keyword.

Create fresh, unique content

New content will not only keep your existing visitor base coming back, but also bring in new visitors. Avoid:

- rehashing (or even copying) existing content that will bring little extra value to people
- having duplicate or near-duplicate versions of your content across your site (more on duplicate content)

Offer exclusive content or services

Consider creating a new, useful service that no other site offers. You could also write an original piece of research, break an exciting news story, or leverage your unique user base. Other sites may lack the resources or expertise to do these things.

Create content primarily for your users, not search engines

Designing your site around your visitors' needs while making sure your site is easily accessible to search engines usually produces positive results. Avoid:

- inserting numerous unnecessary keywords aimed at search engines but are annoying or nonsensical to users
- having blocks of text like "frequent misspellings used to reach this page" that add little value for users
- deceptively hiding text from users, but displaying it to search engines

WRITE BETTER ANCHOR TEXT

Anchor text is the clickable text that users will see as a result of a link, and is placed within the anchor tag ``.

```
<a href="http://www.brandonsbaseballcards.com/articles/ten-rarest-baseball-cards.htm">Top ten rarest baseball cards</a>
```

This anchor text accurately describes the content on one of our article pages

This text tells users and Google something about the page you're linking to. Links on your page may be internal—pointing to other pages on your site—or external—leading to content on other sites. In either of these cases, the better your anchor text is, the easier it is for users to navigate and for Google to understand what the page you're linking to is about.

Good practices for anchor text

Choose descriptive text

The anchor text you use for a link should provide at least a basic idea of what the page linked to is about. Avoid:

- writing generic anchor text like "page", "article", or "click here"
- using text that is off-topic or has no relation to the content of the page linked to
- using the page's URL as the anchor text in most cases (although there are certainly legitimate uses of this, such as promoting or referencing a new website's address)

Write concise text

Aim for short but descriptive text—usually a few words or a short phrase. Avoid:

- writing long anchor text, such as a lengthy sentence or short paragraph of text

Format links so they're easy to spot

Make it easy for users to distinguish between regular text and the anchor text of your links. Your content becomes less useful if users miss the links or accidentally click them.

- Using CSS or text styling that makes links look just like regular text

Think about anchor text for internal links too

You may usually think about linking in terms of pointing to outside websites, but paying more attention to the anchor text used for internal links can help users and Google navigate your site better. Avoid:

- using excessively keyword-filled or lengthy anchor text just for search engines
- creating unnecessary links that don't help with the user's navigation of the site

USE HEADING TAGS APPROPRIATELY

Heading tags (not to be confused with the <head> HTML tag or HTTP headers) are used to present structure on the page to users. There are six sizes of heading tags, beginning with <h1>, the most important, and ending with <h6>, the least important.

```
</head>
<body>
<h1>Brandon's Baseball Cards</h1>
<h2>News - Treasure Trove of Baseball Cards Found in Old Barn</h2>
<p>A man who recently purchased a farm house was pleasantly surprised to find thousands of dollars worth of vintage baseball cards in the barn. The cards were found in newspapers and were thought to be in near-mint condition. After the cards to his grandson instead of selling them.</p>
```

On a page containing a news story, we might put the name of our site into an <h1> tag and the topic of the story into an <h2> tag

Since heading tags typically make text contained in them larger than normal text on the page, this is a visual cue to users that this text is important and could help them understand something about the type of content underneath the heading text. Multiple heading sizes used in order create a hierarchical structure for your content, making it easier for users to navigate through your document.

Good practices for heading tags

Imagine you're writing an outline

Similar to writing an outline for a large paper, put some thought into what the main points and sub-points of the content on the page will be and decide where to use heading tags appropriately. Avoid:

- placing text in heading tags that wouldn't be helpful in defining the structure of the page
- using heading tags where other tags like and may be more appropriate
- erratically moving from one heading tag size to another

Use headings sparingly across the page

Use heading tags where it makes sense. Too many heading tags on a page can make it hard for users to scan the content and determine where one topic ends and another begins. Avoid:

- excessively using heading tags throughout the page
- putting all of the page's text into a heading tag
- using heading tags only for styling text and not presenting structure

OPTIMIZE YOUR USE OF IMAGES

Images may seem like a straightforward component of your site, but you can optimize your use of them. All images can have a distinct filename and "alt" attribute, both of which you should take advantage of.

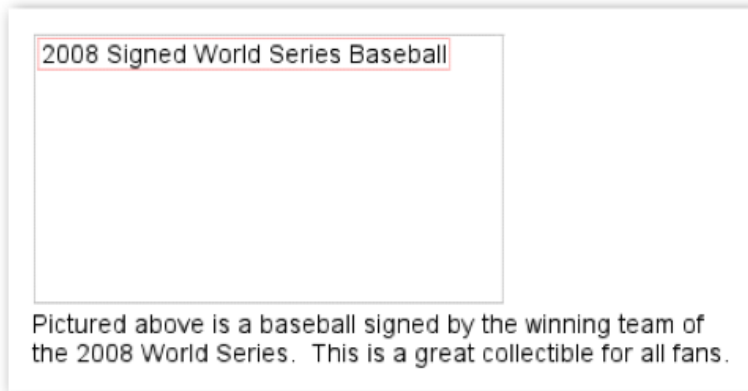

The "alt" attribute allows you to specify alternative text for the image if it cannot be displayed for some reason.

```

```

Our alt text here is a brief but accurate description of the image

Why use this attribute? If a user is viewing your site on a browser that doesn't support images, or is using alternative technologies, such as a screen reader, the contents of the alt attribute provide information about the picture.

Our image wasn't displayed to the user for some reason, but at least the alt text was

Another reason is that if you're using an image as a link, the alt text for that image will be treated similarly to the anchor text of a text link. However, we don't recommend using too many images for links in your site's navigation when text links could serve the same purpose. Lastly, optimizing your image filenames and alt text makes it easier for image search projects like Google Image Search to better understand your images.

Good practices for images

Use brief, but descriptive filenames and alt text

Like many of the other parts of the page targeted for optimisation, filenames and alt text (for ASCII languages) are best when they're short, but descriptive. Avoid:

- using generic filenames like "image1.jpg", "pic.gif", "1.jpg" when possible (some sites with thousands of images might consider automating the naming of images)
- writing extremely lengthy filenames
- stuffing keywords into alt text or copying and pasting entire sentences

Supply alt text when using images as links

If you do decide to use an image as a link, filling out its alt text helps Google understand more about the page you're linking to. Imagine that you're writing anchor text for a text link. Avoid:

- writing excessively long alt text that would be considered spammy
- using only image links for your site's navigation

Store images in a directory of their own

Instead of having image files spread out in numerous directories and subdirectories across your domain, consider consolidating your images into a single directory (e.g. brandonsbaseballcards.com/images/). This simplifies the path to your images.

Use commonly supported filetypes

Most browsers support JPEG, GIF, PNG, and BMP image formats. It's also a good idea to have the extension of your filename match with the filetype.

MAKE EFFECTIVE USE OF ROBOTS.TXT

A "robots.txt" file tells search engines whether they can access and therefore crawl parts of your site. This file, which must be named "robots.txt", is placed in the root directory of your site.

The address of our robots.txt file

```
User-agent: *  
Disallow: /images/  
Disallow: /search
```

*All compliant search engine bots (denoted by the wildcard * symbol) shouldn't access and crawl the content under /images/ or any URL whose path begins with /search*

You may not want certain pages of your site crawled because they might not be useful to users if found in a search engine's search results. If you do want to prevent search engines from crawling your pages your web developer can add a robots.txt file to your website.

Note that if your site uses subdomains and you wish to have certain pages not crawled on a particular subdomain, you'll have to create a separate robots.txt file for that subdomain.

There are a handful of other ways to prevent content appearing in search results, such as adding "NOINDEX" to your robots meta tag, using .htaccess to password protect directories, and using Google Webmaster Tools to remove content that has already been crawled. Google engineer Matt Cutts walks through the caveats of each URL blocking method in a helpful video.

Good practices for robots.txt

Use more secure methods for sensitive content

You shouldn't feel comfortable using robots.txt to block sensitive or confidential material. One reason is that search engines could still reference the URLs you block (showing just the URL, no title or snippet) if there happen to be links to those URLs somewhere on the Internet (like referrer logs). Also, non-compliant or rogue search engines that don't acknowledge the Robots Exclusion Standard could disobey the instructions of your robots.txt. Finally, a curious user could examine the directories or subdirectories in your robots.txt file and guess the URL of the content that you don't want seen. Encrypting the content or password-protecting it with .htaccess are more secure alternatives. Avoid:

- allowing search result-like pages to be crawled (users dislike leaving one search result page and landing on another search result page that doesn't add significant value for them)
- allowing a large number of auto-generated pages with the same or only slightly different content to be crawled: "Should these 100,000 near-duplicate pages really be in a search engine's index?"
- allowing URLs created as a result of proxy services to be crawled

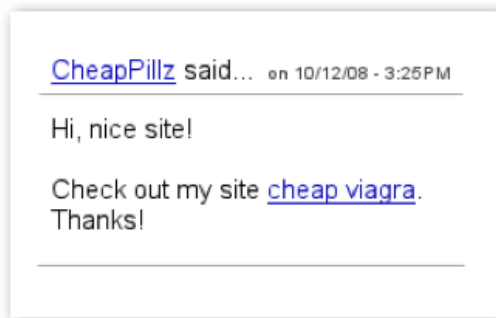

BE AWARE OF REL="NOFOLLOW" FOR LINKS

Setting the value of the "rel" attribute of a link to "nofollow" will tell Google that certain links on your site shouldn't be followed or pass your page's reputation to the pages linked to. Nofollowing a link is adding rel="nofollow" inside of the link's anchor tag.

```
<a href="http://www.shadyseo.com/" rel="nofollow">Comment spammer</a>
```

If you link to a site that you don't trust and don't want to pass your site's reputation to, use nofollow

When would this be useful? If your site has a blog with public commenting turned on, links within those comments could pass your reputation to pages that you may not be comfortable vouching for. Blog comment areas on pages are highly susceptible to comment spam. Nofollowing these user-added links ensures that you're not giving your page's hard-earned reputation to a spammy site. Many blogging software packages automatically nofollow user comments, but those that don't can most likely be manually edited to do this. This advice also goes for other areas of your site that may involve user-generated content, such as guestbooks, forums, shout-boards, referrer listings, etc. If you're willing to vouch for links added by third parties (e.g. if a commenter is trusted on your site), then there's no need to use nofollow on links; however, linking to sites that Google considers spammy can affect the reputation of your own site. The Webmaster Help Centre has more tips on avoiding comment spam, like using CAPTCHAs and turning on comment moderation.

A comment spammer leaves a message on one of our news posts, hoping to get some of our site's reputation

Another use of nofollow is when you're writing content and wish to reference a website, but don't want to pass your reputation on to it. For example, imagine that you're writing a blog post on the topic of comment spamming and you want to call out a site that recently comment spammed your blog. You want to warn others of the site, so you include the link to it in your content; however, you certainly don't want to give the site some of your reputation from your link. This would be a good time to use nofollow.

PROMOTE YOUR WEBSITE IN THE RIGHT WAYS

While most of the links to your site will be gained gradually, as people discover your content through search or other ways and link to it, Google understands that you'd like to let others know about the hard work you've put into your content. Effectively promoting your new content will lead to faster discovery by those who are interested in the same subject. As with most points covered in this document, taking these recommendations to an extreme could actually harm the reputation of your site.

Good practices for promoting your website

Blog about new content or services

A blog post on your own site letting your visitor base know that you added something new is a great way to get the word out about new content or services. Other webmasters who follow your site or RSS feed could pick the story up as well.

Don't forget offline promotion

Putting effort into the offline promotion of your company or site can also be rewarding. For example, if you have a business site, make sure its URL is listed on your business cards, letterhead, posters, etc. You could also send out recurring newsletters to clients through the mail letting them know about new content on the company's website.

Know about social media sites

Sites built around user interaction and sharing have made it easier to match interested groups of people up with relevant content. Avoid:

- attempting to promote each new, small piece of content you create; go for big, interesting items
- involving your site in schemes where your content is artificially promoted to the top of these services

Add your business to Google Places

If you run a local business, adding its information to Google Places will help you reach customers on Google Maps and web search. The Webmaster Help Centre has more tips on promoting your local business.

Reach out to those in your site's related community

Chances are, there are a number of sites that cover topic areas similar to yours. Opening up communication with these sites is usually beneficial. Hot topics in your niche or community could spark additional ideas for content or building a good community resource. Avoid:

- spamming link requests out to all sites related to your topic area
- purchasing links from another site with the aim of getting PageRank instead of traffic

MAKE USE OF FREE WEBMASTER TOOLS

Major search engines, including Google, provide free tools for webmasters. Google's Webmaster Tools that help webmasters better control how Google interacts with their websites and get useful information from Google about their site. Using Webmaster Tools won't help your site get preferential treatment; however, it can help you identify issues that, if addressed, can help your site perform better in search results.

With the service, webmasters can:

- see which parts of a site Googlebot had problems crawling
- upload an XML Sitemap file
- analyse and generate robots.txt files
- remove URLs already crawled by Googlebot
- specify the preferred domain
- identify issues with title and description meta tags
- understand the top searches used to reach a site
- get a glimpse at how Googlebot sees pages
- remove unwanted sitelinks that Google may use in results
- receive notification of quality guideline violations and file for a site reconsideration

TAKE ADVANTAGE OF WEB ANALYTICS SERVICES

If you've improved the crawling and indexing of your site using Google Webmasters Tools or other services, you're probably curious about the traffic coming to your site. Web analytics programs like Google Analytics are a valuable source of insight for this. You can use these to:

- get insight into how users reach and behave on your site
- discover the most popular content on your site
- measure the impact of optimisations you make to your site (e.g. did changing those title and description meta tags improve traffic from search engines?)

For advanced users, the information an analytics package provides, combined with data from your server log files, can provide even more comprehensive information about how visitors are interacting with your documents (such as additional keywords that searchers might use to find your site).

Lastly, Google offers another tool called Google Website Optimizer that allows you to run experiments to find what on-page changes will produce the best conversion rates with visitors. This, in combination with Google Analytics and Google Webmaster Tools, is a powerful way to begin improving your site.

RESOURCES
